

You're thinking of `dd()` 👍

That's the correct Laravel command.

In Laravel, `dd()` = **Dump and Die**

It prints data and **stops execution**, so it's perfect to **confirm whether a specific page/view is being loaded or not**.

1 Most common: confirm this Blade page is loading

Put this **anywhere in the Blade file** (top is best):

```
php

{{ dd('This page is loaded') }}
```

If you see this text → ☒ **Yes, this page is being rendered**

2 Check which ROUTE is opening this page (very useful)

```
php

{{ dd(Route::currentRouteName()) }}
```

Example output:

```
csharp

event.create
```

This confirms **exactly which route** is loading the UI.

3 Check current URL or path

```
php

{{ dd(request()->path()) }}
```

or

```
php

{{ dd(url()->current()) }}
```

4 Check controller data coming to this page

Example (if `$group_id` is passed):

```
php
```

```
{{ dd($group_id) }}
```

or all variables:

```
php
```

```
{{ dd(get_defined_vars()) }}
```

5 Confirm page conditionally (recommended clean way)

Instead of `dd`, you can check without breaking UI:

```
php
```

```
@if(request()->routeIs('event.create'))  
    <script>console.log('Event create page loaded');</script>  
@endif
```

6 Difference between similar commands (quick)

Command	Meaning
<code>dd()</code>	Dump + Die (stops page)
<code>dump()</code>	Dump only (page continues)
<code>@dd()</code>	Blade-safe dd
<code>logger()</code>	Writes to logs

✓ BEST for your case

Use this first:

```
php
```

```
{{ dd(Route::currentRouteName()) }}
```

That will 100% confirm if this UI belongs to that page or not.

If you want, tell me:

- controller name
- route name

- or where you want to put this check

I'll give you the **cleanest Laravel way** (no hacks).
